

BuySellPoint

What does it do:

A simple windows application for individuals who trade shares as a side hobby. It helps to keep track of prices of shares of your choice, and to get runtime WindowsNotification.

Technologies:

Python, yahoo finance.

Known issues:

1. For some stock symbols, yahoo finance gives delayed price.
=> Future plans to support other third party libraries, like Degiro.

[FIXED]

2. Notifications cannot be stopped while application is running.
=> Future plans to control notifications (how long, how many, what time of the day) at runtime.
==: Every symbol has its own config file with options to control notifications

Added Features:

- 1.

Planned Features:

1. Automate Buy/Sell point suggestions based on history, news and user's tolerance of risk.
2. Integration with third party libraries to automatically create symbol list using your portfolio and favorites.

Disclaimers:

1. There is no guarantee that stock prices received from free available libraries like yFinance or others are always correct and/or going to work.
2. This applications is purely an outcome of hobby project.
